### 1. Description

This specification is applied to U8R216 Contact Image Sensor module (CIS).

### 2. Scope

This U8R216 is a CIS consists of a Rod Lens Array, a LED light source guide and an array of linear MOS image sensor.

### 3. Outline

Item	Specification	Note
Scanning width	216 mm	
Sensor element density	8 dot/mm	
Number of sensor elements	1728 elements	
Scanning speed	5 msec/line	
Clock speed	500 KHz	
Rod lens array	Single row	
Light source	$\lambda_p = 520 \text{ nm}$ Band width =30nm +24V x 30 mA	Light Guide
Power supply	+5V x 50 mA	
Data output	1 analog output	Synchronous
Block diagram	Fig.4	
Dimensions	Fig.1-1, Fig.1-2, Fig.1-3	

**4. Image Data Output Characteristics (Ta = 25°C )**

The shipment test of HEC is done on the condition of this table.

Item	Symbol	Specification	Note
DC supply voltage	Vdd	+5.0V	Detector, Logic
	Vled	+24.0V	LED
White image target		0.05 ~ 0.09 OD	
Timing chart		Fig.5	
White output average	Vp	1.4 ± 0.2V	4.1
White output uniformity	Up	Less than 30%	4.2
Dark output	Vd	0 ~ 150mV	4.3
Dark output uniformity	Ud	Less than 100mV	4.4
MTF		More than 30%	4.5 3.85lp/mm

The output level of image signal like white and dark and MTF is defined at the point of “ts1” which described in section 6.

A test target is set on the reading position described Fig.1 outline.

**4.1 Vp**

Vp is the middle of white output signal and is define by:

$$Vp = (Vpmax + Vpmin) / 2$$

$$Vpmax = MAX[Vp(n)]$$

$$Vpmin = MIN[Vp(n)]$$

Vp(n) is the output signal of the nth pixel using a white image target.

**4.2 Up**

Up is the white output non-uniformity and is define by:

$$Up = ((Vpmax - Vp) / Vp) \times 100\% \text{ or}$$

$$((Vp - Vpmin) / Vp) \times 100\%$$

**4.3 Vd**

As shown in Figure 2, Vd is the output signal in the dark (turning off the LED) .

**4.4 Ud**

Ud is the dark output non-uniformity and is defined by:

$$Ud = Vdmax - Vdmin$$

$$Vdmax = MAX[Vd(n)]$$

$$Vdmin = MIN[Vd(n)]$$

Vd(n) is the output signal of the nth pixel turning off the LED .

**4.5 MTF**

Modulation Transfer Function is defined by:

$$MTF = \{ [(V_{max}-V_{min}) / (V_{max}+V_{min})] \} \times 100\%$$

$V_{max}$  is the maximum output signal using the MTF image target

$V_{min}$  is the minimum output signal using the MTF image target

**4.6** Dark compensation is achieved by subtracting the dark level of every pixel.

**4.7** For the best performance two points correction (dark and white) is strongly recommended.

[p9-1]

**Figure 2. Output Signals Waveform**

### 5. Maximum Rating

Item	Symbol	Specification	Note
DC supply voltage	Vdd	+5V ± 0.25V	
	Vled	+24V ± 1.2V	
Input voltage	Vin	0 ~ Vdd+0.3V	SI, CLK
Ambient temperature	Ta	0 ~ +50 °C	Opearating
		-20 ~ +60 °C	Non-operating
Ambient humidity		10 ~ 90%RH	Avoid a build up condensation
Maximum operating Temperature		65 °C 30minutes MAX	

### 6. Electrical Characteristics (Ta = 25 °C)

Item	Symbol	Condition	Specification			Unit
			Min.	Typ.	Max.	
DC supply Voltage	Vdd	GND reference	4.75	5.0	5.25	V
	Vled	Gled reference	22.6	24.0	25.2	V
DC supply Current	Idd	Vdd = 5V			70	mA
	Iled	Vled = 24V		20	30	mA
Input voltage (Note 1)	Vih	SI,CLK	3.7			V
	Vil				1.4	V
Input Current (Note 1)	Iih	SI,CLK			± 0.1	μA
	Iil				± 4	μA
Clock frequency	f	CLK		500	1,000	KHz
Clock pulse "L" duty		tw(T)/to to=1/f	73	75	77	%
SI delay time	td1	SI-CLK	200		to	ns
	td2	SI-CLK	0		to – 200	ns
Data output stability time	ts1	CLK-SIG	0		50	ns

(Note1) 74HC244 or equivalent is recommended for input signal.

**Figure 3. Timing Diagram**

[p5-1]

## 7. Reliability

The following table satisfies the reliability when the CIS is operated continuously under standard operating conditions as specified in section 4.

Item	Variable Amount (%)	Note
White output ( $V_p$ )	Initial level +10% -30%	1000Hr
	Initial level +10% -50%	5000Hr

**8. Precautions before use:**

**8.1 Glass surface**

The Glass surface should be kept clean. Don't wipe the glass surface with hand. Don't use the CIS module in a dust-polluted environment. If the glass surface gets dirty, wipe the glass surface gently with a clean cloth soaked in alcohol. The glass surface should be wiped very carefully.

**8.2 Extracting / Inserting the connector**

The maximum number of times that the connector should be extracted and connected is 10. If the connector is inserted / extracted more than 10 times, the connector 'burrs' will be eroded, thereby making the connector ineffective.

**8.3 Stable operation**

(1) The connector pins should not be touched by bare hand or electrostatic charge materials.

**(2) Noise**

- a. Insert a low frequency noise suppressing capacitor(100uF) between Vdd(+5V) and GND. A high frequency noise suppressing capacitor is already integrated into the circuit.
- b. Ensure that the sensor connecting cables are 30cm or less in length. The CLK and GND, SIG and GND and Vled and Gled respectively from form twisted cable pairs.

**(3) Latch up**

When the supply voltage is higher than the absolute maximum, latch up will cause the sensor to break, even if the voltage is caused by a surge. If the current varies rapidly in the external in the external circuit, or when the power is turned on an off very frequently, ensure that the voltage o each terminal does not exceed the values indicated in below.

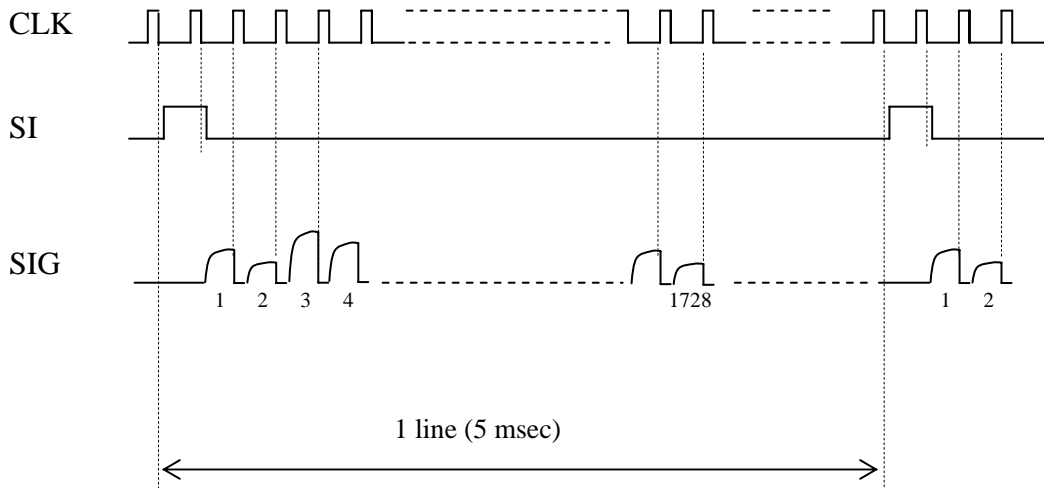

**(4) Absolute maximum ratio**

Item	Symbol	Condition	Specification		Unit
			Min	Max	
Supply Voltage	Vdd	GND reference	-0.3	+6.5	V
Input voltage	Vin	SI,CLK	GND-0.3	Vdd+0.3	V

**Figure 4. Block Diagram**

CLK:500KHz (L:duty 75%)  
This is the SHEC shipping test condition.

**Figure 5. Line Timing Diagram**

**Figure 6. Typical Performance Curve**

Unless otherwise specified, Ta=25°C, Scanning speed = 5msec/line,  
Clock speed=500KHz, Vdd=5.0V, and Vled=24.0V

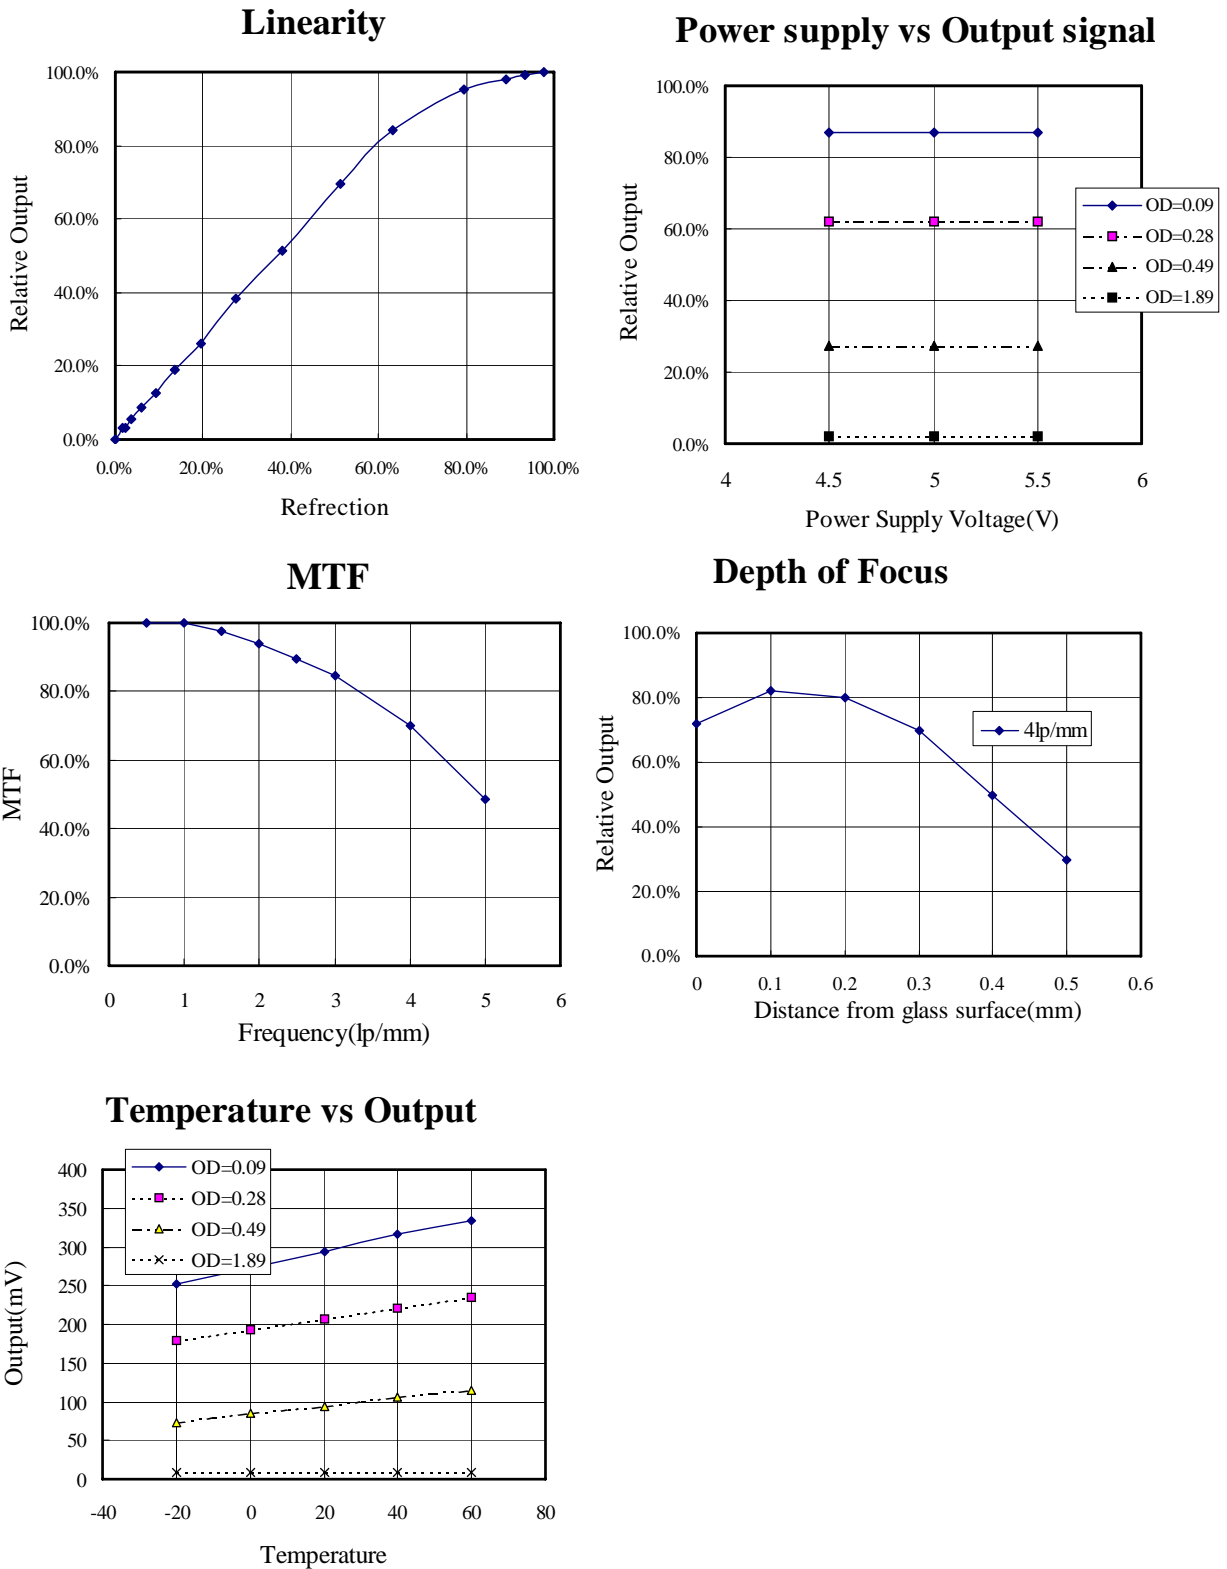

Figure 1-2. U8R216-1 dimensions

PIN CONNECTION

PIN NO.	NAME
1	SIG
2	GND
3	VDD(+5V)
4	NC
5	GND
6	SI
7	GND
8	CLK
9	GLED
10	VLED(+24V)
